What's a Network?

What's a Network?

A **network** is two or more computer systems linked together by some form of the transmission medium that enables them to share information

What's a Network?

Provides services like:

- Access to shared files/folders
- Access to printers/scanners
- Email applications
- Database applications
- Web applications
- Voice over IP (VoIP)
- Multimedia conferencing

What's a Network?

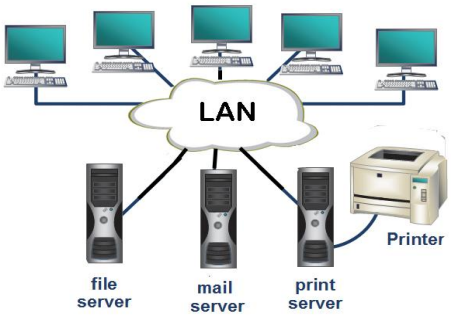
Features of Computer Network

- **Performance** → Response time
- **Data Sharing**
- **Backup**
- **Reliability** → No failures!
- **Security** → Keep data safe!
- **Scalability** → New systems can be added
- **Software and hardware compatibility**

2 Local Area Network (LAN)

Local Area Network (LAN)

A LAN is a **local** network



- Could be as small as two computers or large, with thousands of devices connected
- Usually restricted to spanning a particular geographic location

A company in a single building is considered as LAN

True

False

Students choose an option

A company consisting of multiple buildings in the same area is considered as LAN

Students choose an option

Do not remove this bar

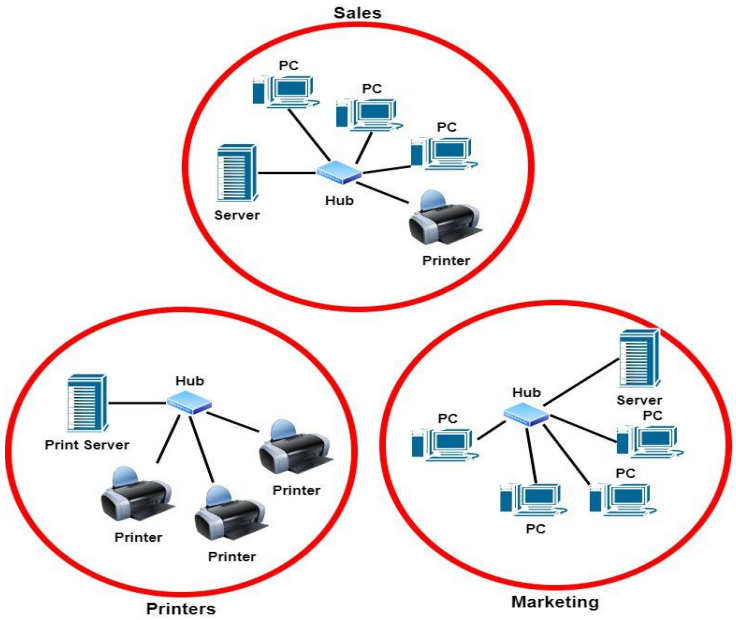
Local Area Network (LAN)

LAN's size and the distance a LAN can span is not restricted

But it's best to split a big LAN into smaller logical zones known as **workgroups** to make administration easier

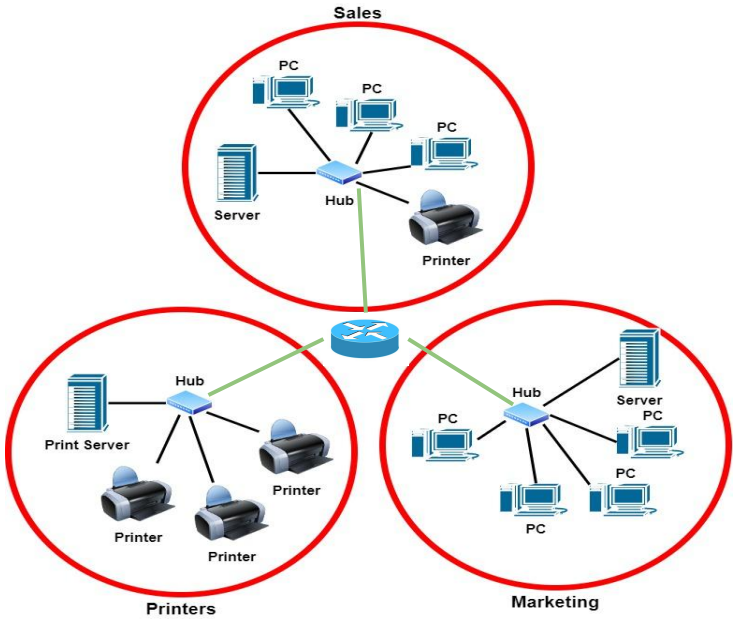
Local Area Network (LAN)

3 LANs, each has its own workgroup



Local Area Network (LAN)

A LAN with 3 workgroups



3 Common Network Components

Common Network Components

- **Node** → - A point or joint where a connection takes place
  - Can be a computer or device
- **Station** → A node on a wireless network

- PC	- Printer
- Laptop	- Router
- Server	- Switch
- Smartphone	- etc.

Some examples of Node

Common Network Components

- **Host** ⟶
  - Requires IP Address
  - Can be a client or server
- **Workstation** ⟶
  - Powerful computer designed for technical or scientific applications
  - Used by one person at a time

Common Network Components

- **Server** ⟶ A powerful computer used to store files and run programs centrally
- **Client** ⟶ A device that makes request to a server

- Web Server	- Application Server
- Proxy Server	- DNS Server
- Mail Server	- File Server
- Print Server	- Telephony Server

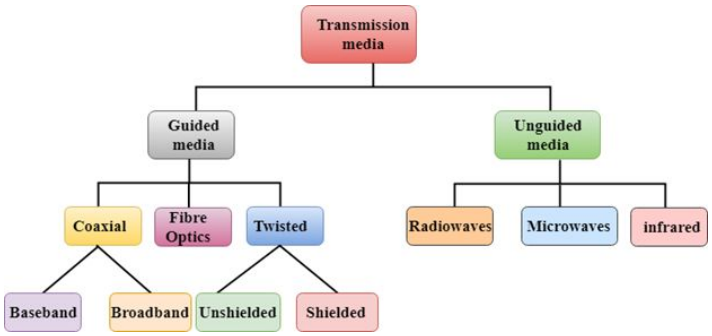
Common types of servers

Common Network Components

- **Segment** → - Refers to a specific physical region of a network
  - Typical usage is to describe the link between a computer and a switch
  - Another usage is to refer to a region of the network where all the nodes use the same type of transmission media
- **Backbone** → A fast link between other segments of a network

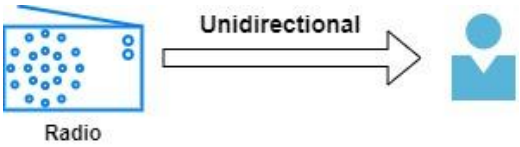
Common Network Components

- **Transmission Media** → - A communication channel between **nodes** that carries the information from the sender to the receiver
  - Data is transmitted through the electromagnetic signals

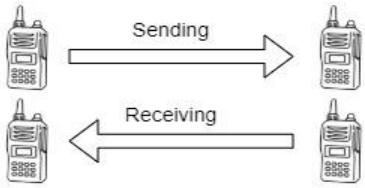


Cable Properties

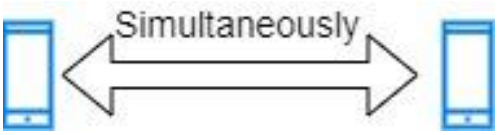
Simplex



Half-duplex



Full-duplex



4 Wide Area Network (WAN)

Wide Area Network (WAN)

A **WAN** is a collection of computers and devices connected by a communications network over a wide geographic area

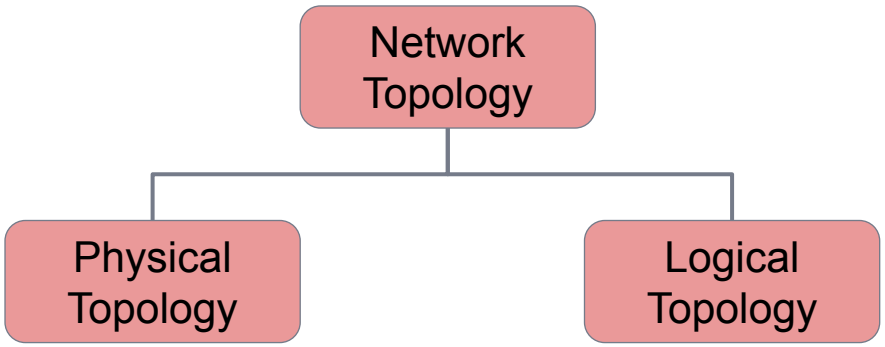
WANs are commonly connected either through the Internet or special arrangements made with phone companies or other service providers

The **Internet** is considered the **largest WAN** in the world

5 Network Topology

Network Topology

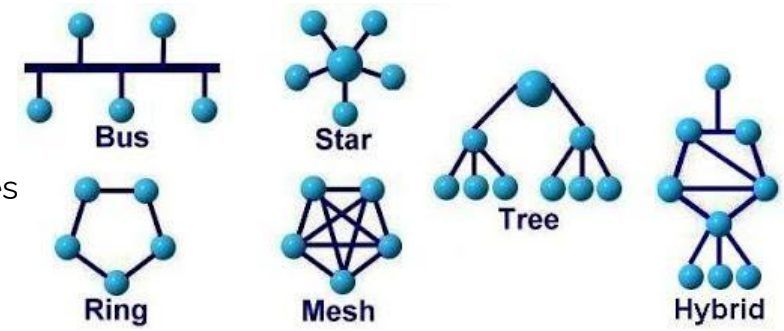
Network topology is the description of the arrangement of **nodes** and **connections** in a network



Network Topology

A **physical topology** details how devices are physically connected

Depends on:
- Office layout
- Troubleshooting techniques
- Cost of installation
- Type of cable used



Network Topology

Logical topology describes the way in which a network transmits information from network/computer to another

It's not the way the network looks or how it is laid out

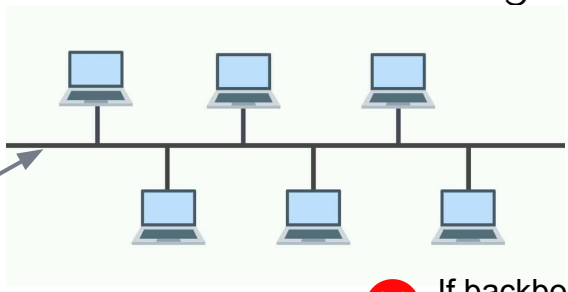
6 Physical Network Topologies

Bus Topology
Ring Topology
Tree Topology
Star Topology
Mesh Topology
Hybrid Topology

Physical Network Topologies

Bus Topology:

Every node is connected in series along a linear path

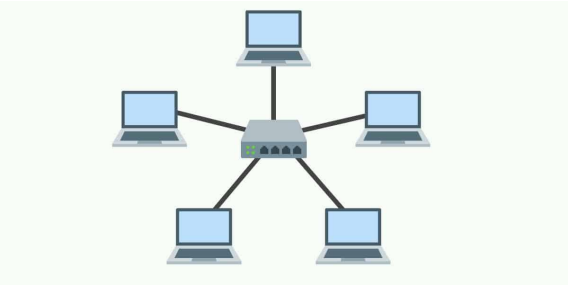


- ✓ Keeps the layout simple
- ✓ Cost effective
- ✗ If backbone fails entire network goes down
- ✗ Decreased network performance
- ✗ Not scalable

Physical Network Topologies

Star Topology:

Every node in the network is connected to one central switch

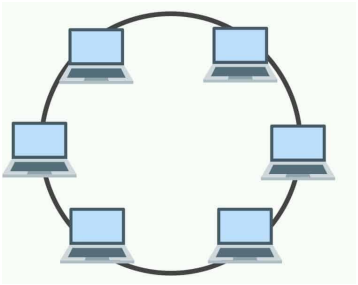


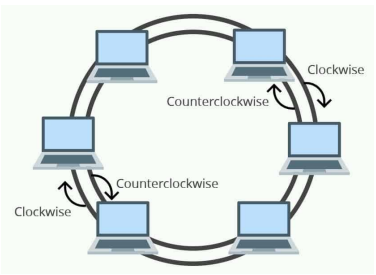
- ✓ Easy to manage
- ✓ Requires fewer cables
- ✗ If central switch fails entire network goes down
- ✗ Performance is up to central switch

Physical Network Topologies

Ring Topology:

Every node is connected to each other in a circular format.





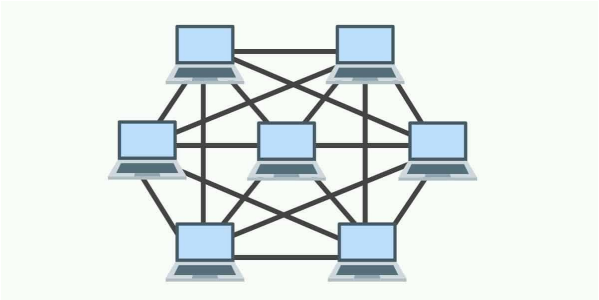
- Low risk of packet collision
- Easy to install

- Vulnerable to failure
- The more devices added the more communication delay
- To make changes the network should be shut down

Physical Network Topologies

Mesh Topology:

A point-to-point connection where nodes are interconnected



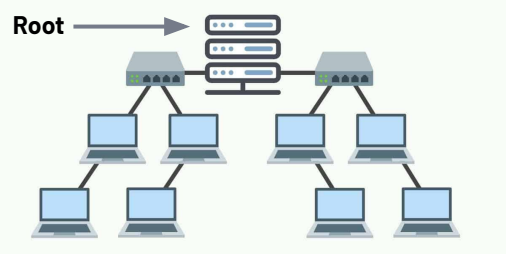
- Reliable

- Configuration is complex
- Expensive

Physical Network Topologies

Tree (Hierarchy) Topology:

A network structure that is shaped like a tree with its many branches

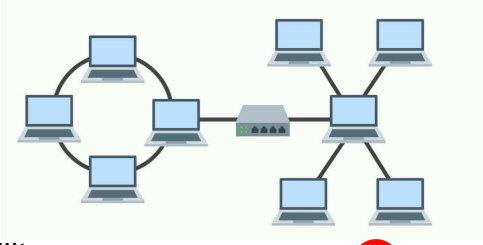


- ✓ Scalable
- ✓ Manageable
- ✗ Hard to maintain
- ✗ If root fails entire network goes down

Physical Network Topologies

Hybrid Topology:

A combination of two or more types of physical or logical network topologies working together within the same network



- ✓ Flexibility
- ✗ Quite complex
- ✗ Can be quite costly
